## Is F-theory a theory?

## W. Siegel

## Geometrical Aspects of Supersymmetry October 22, 2018

in collaboration with:
W.D. Linch, III ('15-17)
M. Poláček ('14)
C.-Y. Ju ('16)
D. Wang ('18)

## What the F is "F-theory"?

We still don't even know what the " $M$ " in "M-theory" is.
String theory > just supergravity (low energy).
Supergravity > just compactifications (vacua).
"Stringy" theory with all symmetries (S,T,U,...) manifest?*

- String \& M theories $\leftarrow$ "semi-unitary gauges" with spontaneous symmetry breaking by solving worldvolume constraints (cf. lightcone).
- More symmetry manifest $\leftarrow$ "covariant gauges" with ghost worldvolume coordinates.
*Vafa

## The story so far:

- consistently quantizable branes
- Spacetime coordinates $X(\sigma)=$ worldvolume gauge field with selfdual field strength.
- $\Rightarrow$ Spacetime indices = worldvolume indices.
- Zeroth-quantization: $\sigma$ also = gauge field?

## Want to better understand...

- supersymmetry (super $\sigma$ )
- worldvolume Lagrangian (worldvolume metric)
- (STU) covariant quantization (ghost $\sigma$ )
- higher dimensions ( $\mathrm{E}_{11}$ ?*)

## Symmetries

|  | exceptional |  | tangent | $\mathrm{U}: \mathrm{d} \supset \mathrm{d}-1$ |  |
| :--- | :---: | :---: | :--- | :--- | :--- |
| $\mathscr{L}$ (agrangian) | F | $\supset$ | L | $\supset:$ | maximal |
|  | U |  | $U$ |  | compact |
| $\mathscr{H}$ (amiltonian) | G | $\supset$ | H |  | subgroup |

Some cases

| D | $\mathbf{d}$ | F | G | L | H |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 2 | $\mathrm{GL}(2)$ | $\mathrm{GL}(1)$ | $\mathrm{GL}(1, \mathrm{C})$ | I |
| 1 | 3 | $\mathrm{GL}(3)$ | $\mathrm{GL}(2)$ | $\mathrm{GL}(2)$ | $\mathrm{SO}(1,1)$ |
| 2 | 4 | $\mathrm{SL}(4) \mathrm{SL}(2)$ | $\mathrm{SL}(3) \mathrm{SL}(2)$ | $\mathrm{GL}(2)^{2}$ | $\mathrm{GL}(2)$ |
| 3 | 6 | $\mathrm{SL}(6)$ | $\mathrm{SL}(5)$ | $\mathrm{GL}(4)$ | $\mathrm{Sp}(4)$ |
| 4 | 12 | $\mathrm{SO}(6,6)$ | $\mathrm{SO}(5,5)$ | $\mathrm{GL}(4, \mathrm{C})$ | $\mathrm{Sp}(4, \mathrm{C})$ |
| 5 | 56 | $\mathrm{E}_{7(7)}$ | $\mathrm{E}_{6(6)}$ | $\mathrm{U}^{*}(8)$ | $\mathrm{USp}(4,4)$ |
| 6 | $\infty ?$ | $\infty ?$ | $\mathrm{E}_{7(7)}$ | $\mathrm{U}^{*}(8)^{2}$ | $\mathrm{SU}^{\star}(8)$ |
| 7 | $\infty ?$ | $\infty ?$ | $\mathrm{E}_{8(8)}$ | $\mathrm{U}^{*}(16)$ | $\mathrm{SO}^{\star}(16)$ |

- $\mathrm{D}=$ spacetime, after reduction to usual string theory
- d = worldvolume, before reduction

H = Lorentz covering with double argument

For lower D, resemble gravity/"double field theory":
D
F
G
0-3 GL(d) GL(d-1)
L
H
$4 \quad \operatorname{SO}\left(\frac{d}{2}, \frac{d}{2}\right) \quad \operatorname{SO}\left(\frac{d}{2}-1, \frac{d}{2}-1\right)$
SO(d) SO(d-1)
$S O\left(\frac{d}{2}, C\right) \quad S O\left(\frac{d}{2}-1, C\right)$

F groups in $D$ dimensions are Wick rotations of $N=D+2$ exceptional symmetries for 4D sugra:

| $D$ | $F_{D}$ | $E_{N}$ | $N$ |
| :--- | :--- | :--- | :--- |
| 0 | $G L(2)$ | $U(2)$ | 2 |
| 1 | $G L(3)$ | $U(3)$ | 3 |
| 2 | $\operatorname{SL}(4) S L(2)$ | $\operatorname{SU}(4) \operatorname{SU}(1,1)$ | 4 |
| 3 | $\operatorname{SL}(6)$ | $\operatorname{SU}(5,1)$ | 5 |
| 4 | $\operatorname{SO}(6,6)$ | $S O^{*}(12)$ | 6 |
| 5 | $E_{7(7)}$ | $E_{7(7)}$ | $7(8)$ |

## Worldvolume fields (Lagrangian)

$$
\delta X=\partial \zeta, \quad F=\partial X
$$

| D | F | pattern | $\sigma$ | $\zeta$ | $\boldsymbol{X}$ | $\boldsymbol{F}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{0}$ | $\mathrm{GL}(\mathbf{2 )}$ | forms | $\mathbf{2}$ | $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{2}$ |
| $\mathbf{1}$ | $\mathrm{GL}(\mathbf{3})$ | forms | $\mathbf{3}$ | $\mathbf{0} \oplus \mathbf{1}$ | $\mathbf{1} \oplus \mathbf{3}$ | $\mathbf{3} \oplus \mathbf{3}^{\prime}$ |
| $\mathbf{2}$ | $\mathrm{SL}(4) \mathrm{SL}(2)$ | forms | $\mathbf{( 4 , 1 )}$ | $(\mathbf{1 , 2})$ | $\mathbf{( 4 , 2 )}$ | $(\mathbf{6 , 2})$ |
| $\mathbf{3}$ | $\mathrm{SL}(6)$ | forms | $\mathbf{6}$ | $\mathbf{6}$ | $\mathbf{1 5}$ | $\mathbf{2 0}$ |
| $\mathbf{4}$ | $\mathrm{SO}(6,6)$ | spinors | $\mathbf{1 2}$ | $\mathbf{3 2}$ | $\mathbf{3 2}$ | $\mathbf{3 2}$ |
| $\mathbf{5}$ | $\mathrm{E}_{7(7)}$ | infinite | $\mathbf{5 6}$ | $\mathbf{9 1 2}$ | $\mathbf{1 3 3}$ | $\mathbf{5 6}$ |

Imposing selfduality on $\boldsymbol{F}$ breaks symmetry $\mathbf{F} \rightarrow \mathbf{L}$ (in absence of background).

## Current algebra (Hamiltonian)

$\mathscr{L} \rightarrow \mathscr{H}: X \rightarrow X_{\tau} \oplus X_{\sigma}$

- $X_{\tau}=$ Lagrange multiplier for Gauss (cf. part of $\zeta$ )
- $X_{\sigma}=$ "physical" (cf. selfdual part $\triangleright$ of $F$ )

$$
i\left[\triangleright_{A}, \triangleright_{B}\right\}=\delta f_{A B}{ }^{c} \triangleright_{C}-2 \eta_{A B}{ }^{c} \mathscr{D}_{c} \delta
$$

$\mathscr{D}_{a}=g_{a}{ }^{m} \partial_{m}, \quad D_{A}=R_{A}{ }^{M} P_{M}+\left(\eta_{A B}{ }^{c}+B_{A B}{ }^{c}\right)\left(\mathscr{D}_{c} X^{M}\right) R_{M}{ }^{B}$

$$
\begin{cases}\text { Virasoro: } & \mathcal{S}_{a}=\eta_{a}^{B C} D_{B} D_{C} \\ \text { Gauss: } & \mathscr{U}_{\mathscr{A}}=\mathcal{f}_{\mathscr{A}^{b C}}^{\mathscr{D}_{b}} D_{C}\end{cases}
$$

Background: $\left(\mathscr{D}_{a}, \nabla_{A}, f_{A B}{ }^{C}\right) \rightarrow\left(E_{a}{ }^{m} \mathscr{D}_{m}, E_{A}{ }^{M} \nabla_{M}, T_{A B}{ }^{C}\right)$
Gauge transformations: $\int \Lambda^{M} D_{M} ;\left(E_{a}{ }^{m}, E_{A}{ }^{M}\right) \in \mathrm{G} / \mathrm{H}$

## Reductions (\& extended gravities G/H)

* Coimbra, Strickland-Constable, \& Waldram; Berman, Cederwall, Kleinschmidt, \& Thompson ${ }^{\dagger}$ WS, but string has Duff/Tseytlin doubled $X$

## Simple example: 3D bosonic (d=6)

F

$$
\sigma_{m}=5, X^{[m n]}=10
$$

## SL(5)/O(3,2)

Defining-rep G-symmetry indices: $\mathrm{F}: m=-1,0,1,2,3$ time $=-1,0$; space $=1,2,3$
$\mathrm{M}: i=0,1,2,3$
$\mathrm{T}: i=-1,0,1,2$
S: $\quad$ l $=0,1,2$

Sectioning, in $\mathscr{H}$ formalism, uses $P \rightarrow p$ :

Apply also to products of fields
$\Rightarrow$ the $\mathbf{2}$ derivatives in constraint to $\mathbf{2}$ different fields.

- Virasoro: F $\rightarrow$ M: $P_{i j}=p_{i j}=\mathbf{0}$,
leaves $\sigma_{m} \& X^{-1 i}$ (still 5-brane, but in $\mathrm{D}=4$ )
- Gauss: $\mathrm{F} \rightarrow \mathrm{T}: P_{3 i}=p_{3 i}=\partial^{i}=0$, leaves $\sigma_{3} \& X^{i j}$ (string, but in $\mathrm{D}=3+3$, $\mathrm{SD} \& \overline{\mathrm{SD}} X^{i j}$ )
- both: $\mathrm{F} \rightarrow \mathrm{S}$ : leaves $\sigma_{3} \& X^{-1 t}$ (string in $\mathrm{D}=3$ )

## P.S. Martin Roček is a great guy!
